

# ACRO ASSESSMENT FOR CONSULTANTS

## AN EASY, AGILE, AUTOMATED APPROACH TO CYBER RISK ASSESSMENTS

*As a leading provider of cyber risk management solutions, Cytegic provides an automated end-to-end solution that encompasses the entire scope of cyber risk management.*

As a consultant, the time spent conducting an accurate and effective cyber risk assessment, drastically outweighs the time spent security planning or remediating flaws and gaps. In some cases, we have seen 80% of the consultants time allotted to a project strictly exhausted just in the assessment phase, leaving only 20% of the time allotted for getting the job done. By the time your assessment is complete, the data utilized may no longer be accurate. Cytegic's Automated Cyber Risk Officer for Consultants provides an easy and automated approach to provide your customers with an assessment in minutes...not days or weeks.

### ACRO FOR CONSULTANTS CONSISTS OF 9 STEPS:

### ABOUT CYTEGIC

Cytegic's patented, scientific approach provides digital related risk oversight across the organization and compile your risk report with recommendations for what needs to be prioritized regarding your Cyber Risk appetite.

## Engagement Scope

Cytegic's ACRO for Consultants allows you to easily determine the size and breadth of your customers project. To begin the process, ACRO helps you gain quick and accurate knowledge of what components of your customers organization will be engaged.

- **Enterprise Discovery:** Allows the engagement manager to coordinate and easily determine the scope of the project with the client. With just a few clicks you will gain access to the number of environments/business-units that will be included in the engagement.

---

## Data Collection

- **Environment Discovery:** Once the scope of the engagement has been determined, ACRO provides you with the tools necessary to gather your selected environment profile attributes and controls maturity data.
- **Controls Definition:** Cytegic evaluates over 50 families of controls that are divided into 3 specific control types; infrastructure, preventative and detective. Each control type is comprised of different sets that correspond to specific paths in their defensive tier.
- **Controls Relevance and Existence:** Easily determine what controls are relevant or do not exist within the environment being assessed.
- **Source of Controls Data:** This is a two-phased approach where the configuration files of each attainable control pulled in an automated fashion, the remaining data is gathered utilizing a questionnaire. Data points such as HR processes for example may fall into the questionnaire bucket.

---

## Analytics

Once the system is populated with environment data, risk and control maturity, the analysis can be performed. ACRO allows the cyber analyst to validate and interpret the results of the assessment, providing the engagement manager with reports, findings and control remediation recommendations.

---

## Engagement Transformation

With a presentation ready report generated for your customer you can easily define guidelines for the steps in your remediation plan while providing accurate and agile steps for implementing a continuous monitoring strategy that represents the needs of your client
